Total Marks: _____ / 20

Time: 20 minutes

Component/Data Flow Diagram (CO2)

A company named diagramAkleMathaGhuray is developing a business-class solution for the enterprise edition. Their software has five components: **X**, **E**, **F**, **Y**, and **Z**.

P – Provided Interface, **R** – Required Interface

X has three internal components (**X1**, **X2**, **X3**). **X1** provides **X1P1**, **X2** provides **X2P1** and **X2P2**, and **X3R1** is dependent on **X2P2**. For future improvements, **X1** and **X2** have **X1R1** and **X2R1**. **E** requires **X1P1** and **X2P2** and processes them through the **ER1** interface, and provides **EP1** and **EP2** to **F**'s **FR1** and **FR2**.

Next, **Y** has two components, **Y1** and **Y2**, and **Y2** has two components, **Y21** and **Y22**. **Y2** provides **Y**'s main output, **Yout**. **Y1** needs to provide **Y1P1** to **Y2R1**. **Y1** takes two inputs to produce **Y1P1**, which are processed via its required **Y1R1** and **Y1R2** interfaces. **Y21** and **Y22** must process the same input from **F**'s provided **FP1** interface.

Lastly, **Z** relies entirely on **X** to provide **ZP1** and **ZP2**, and its outputs are fully utilized (100%).

Draw an appropriate diagram for the above scenario.
